

What is Data Warehouse? (1)

- A data warehouse is a repository of information collected from multiple sources, stored under a unified schema, and that usually resides at a single site
- A data warehouse is a semantically consistent data store that serves as a physical implementation of a decision support data model and stores the information on which an enterprise need to make strategic decisions

What is Data Warehouse? (2)

- Data warehouses provide on-line analytical processing (OLAP) tools for the interactive analysis of multidimensional data of varied granularities, which facilitate effective data generalization and data mining
- Many other data mining functions, such as association, classification, prediction, and clustering, can be integrated with OLAP operations to enhance interactive mining of knowledge at multiple levels of abstraction

What is Data Warehouse? (3)

- A decision support database that is maintained **separately** from the organization's operational database
- “A data warehouse is a subject-oriented, integrated, time-variant, and nonvolatile collection of data in support of management's decision-making process [Inm96].” —W. H. Inmon

Data Warehouse Framework

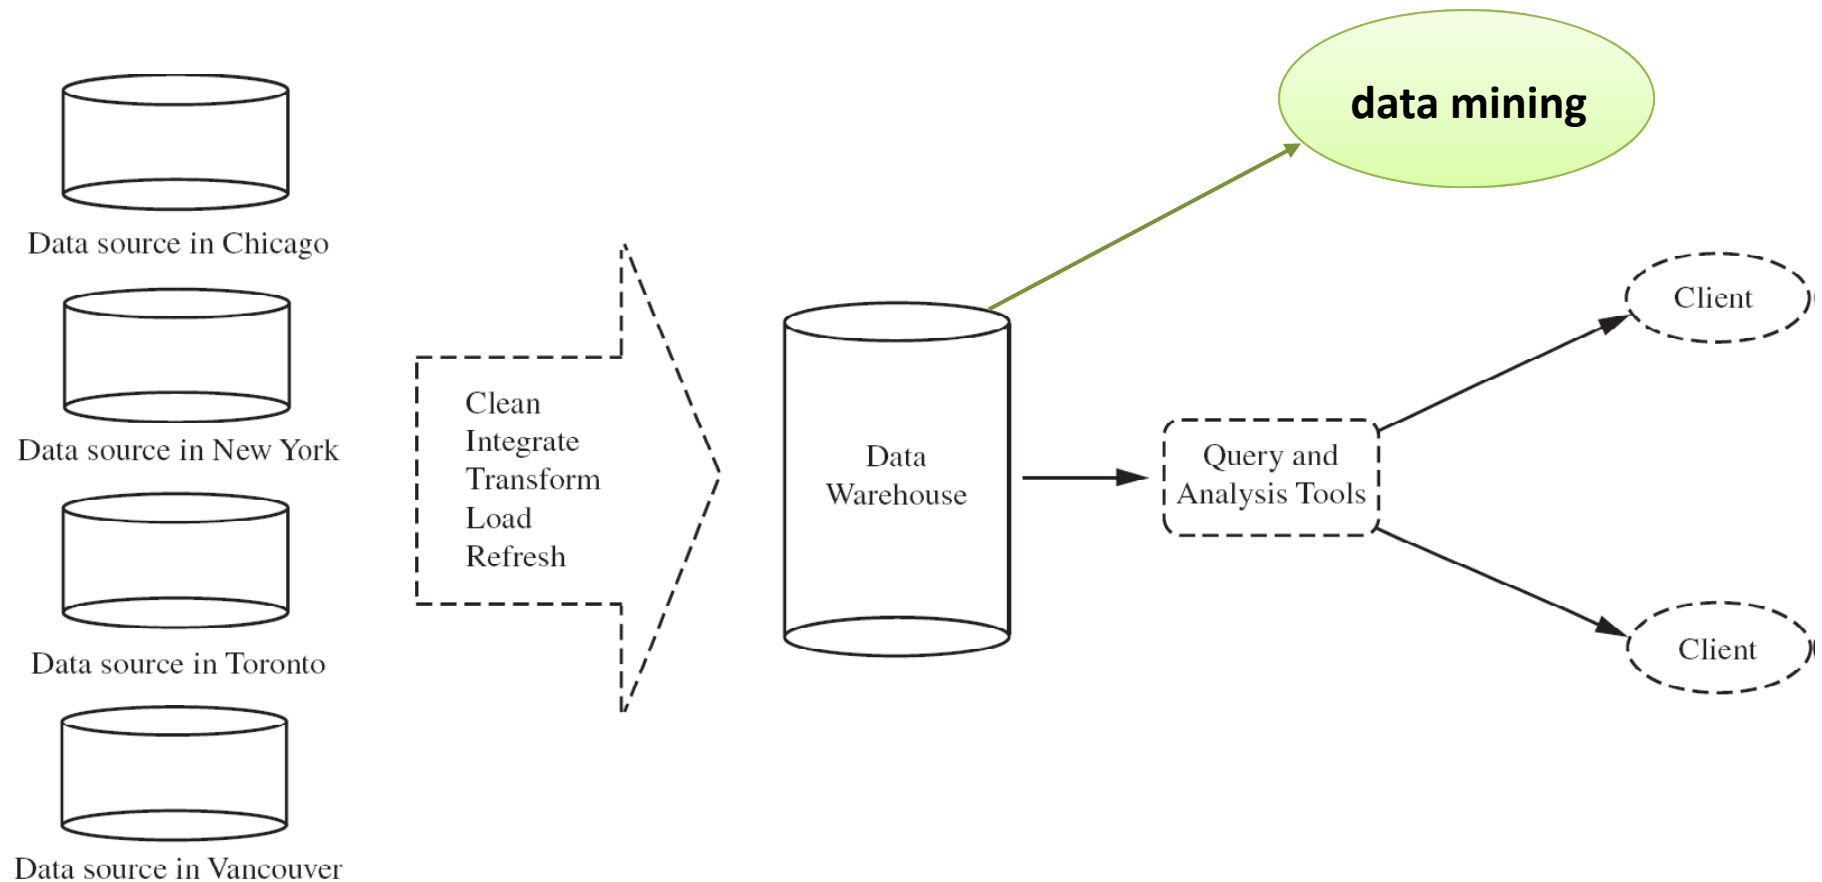

Figure 1.7 Typical framework of a data warehouse for *AllElectronics*

Data Warehouse is *Subject-Oriented*

- Organized around major **subjects**, such as customer, product, sales, etc.
- Focusing on the modeling and analysis of data for decision makers, not on daily operations or transaction processing
- Provide a simple and concise view around particular subject issues by excluding data that are not useful in the decision support process

Data Warehouse is *Integrated*

- Constructed by **integrating** multiple, heterogeneous data sources
 - relational databases, flat files, on-line transaction records
- Data **cleaning** and data **integration** techniques are applied.
 - Ensure consistency in naming conventions, encoding structures, attribute measures, etc. among different data sources
 - E.g., Hotel price: currency, tax, breakfast covered, etc.

Data Warehouse is *Time Variant*

- The time horizon for the data warehouse is significantly longer than that of operational systems
 - Operational database: current value data
 - Data warehouse data: provide information from a historical perspective (e.g., past 5-10 years)
- Every key structure in the data warehouse
 - Contains an element of time, explicitly or implicitly

Data Warehouse is *Nonvolatile*

- A physically **separate** store of data transformed from the operational environment
- Operational update of data does not occur in the data warehouse environment
 - Does not require transaction processing, recovery, and concurrency control mechanisms
 - Requires only two operations in data accessing:
 - *initial loading* of data and *access* of data

OLTP vs. OLAP

| Feature | OLTP | OLAP |
|----------------------------|-------------------------------------|--|
| Characteristic | operational processing | informational processing |
| Orientation | transaction | analysis |
| User | clerk, DBA, database professional | knowledge worker (e.g., manager, executive, analyst) |
| Function | day-to-day operations | long-term informational requirements, decision support |
| DB design | ER based, application-oriented | star/snowflake, subject-oriented |
| Data | current; guaranteed up-to-date | historical; accuracy maintained over time |
| Summarization | primitive, highly detailed | summarized, consolidated |
| View | detailed, flat relational | summarized, multidimensional |
| Unit of work | short, simple transaction | complex query |
| Access | read/write | mostly read |
| Focus | data in | information out |
| Operations | index/hash on primary key | lots of scans |
| Number of records accessed | tens | millions |
| Number of users | thousands | hundreds |
| DB size | 100 MB to GB | 100 GB to TB |
| Priority | high performance, high availability | high flexibility, end-user autonomy |
| Metric | transaction throughput | query throughput, response time |

Table 3.1 Comparison between OLTP and OLAP

Why Separate is Data Warehouse Needed?

(1)

- *Why not perform on-line analytical processing directly on operational databases instead of spending additional time and resources to construct a separate data warehouse?*

Why Separate is Data Warehouse Needed? (2)

- High performance for both systems
 - DBMS— tuned for OLTP: searching for particular records, indexing, hashing, concurrency control, recovery
 - Warehouse—tuned for OLAP: complex OLAP queries, multidimensional view, consolidation (summarization and aggregation)

Topics

- Definition of data warehouse
- **Multidimensional data model**
- Data warehouse architecture
- From data warehousing to data mining

From Tables and Spreadsheets to Data Cubes

- A data warehouse is based on a **multidimensional data model**
- This model views data in the form of a **data cube**
- A **data cube** allows data to be modeled and viewed in multiple dimensions

From Tables and Spreadsheets to Data Cubes (1)

- A data cube is defined by facts and dimensions
 - **Facts** are data which data warehouse focus on
 - Fact tables contain **numeric measures** (such as **dollars_sold**) and keys to each of the related dimension tables
 - **Dimensions** are perspectives with respect to fact
 - Dimension tables describe the dimension with attributes. For example, **item (item_name, brand, type)**, or **time(day, week, month, quarter, year)**

Figure 1.6. Fragments of relations from a relational database for AllElectronics

customer

| <u>cust_ID</u> | name | address | age | income | credit_info | category | ... |
|----------------|--------------|-----------------------------|-----|---------|-------------|----------|-----|
| C1 | Smith, Sandy | 1223 Lake Ave., Chicago, IL | 31 | \$78000 | 1 | 3 | ... |
| ... | ... | ... | ... | ... | ... | ... | ... |

item

| <u>item_ID</u> | name | brand | category | type | price | place_made | supplier | cost |
|----------------|-----------|---------|-----------------|----------|-----------|------------|----------|----------|
| I3 | hi-res-TV | Toshiba | high resolution | TV | \$988.00 | Japan | NikoX | \$600.00 |
| I8 | Laptop | Dell | laptop | computer | \$1369.00 | USA | Dell | \$983.00 |
| ... | ... | ... | ... | ... | ... | ... | ... | ... |

employee

| <u>empl_ID</u> | name | category | group | salary | commission |
|----------------|-------------|--------------------|---------|-----------|------------|
| E55 | Jones, Jane | home entertainment | manager | \$118,000 | 2% |
| ... | ... | ... | ... | ... | ... |

branch

| <u>branch_ID</u> | name | address |
|------------------|-------------|--------------------------------|
| B1 | City Square | 396 Michigan Ave., Chicago, IL |
| ... | ... | ... |

purchases

| <u>trans_ID</u> | cust_ID | empl_ID | date | time | method_paid | amount |
|-----------------|---------|---------|------------|-------|-------------|-----------|
| T100 | C1 | E55 | 03/21/2005 | 15:45 | Visa | \$1357.00 |
| ... | ... | ... | ... | ... | ... | ... |

items_sold

| <u>trans_ID</u> | <u>item_ID</u> | qty |
|-----------------|----------------|-----|
| T100 | I3 | 1 |
| T100 | I8 | 2 |
| ... | ... | ... |

works_at

| <u>empl_ID</u> | <u>branch_ID</u> |
|----------------|------------------|
| E55 | B1 |
| ... | ... |

From Tables and Spreadsheets to Data Cubes (2)

| | | | | |
|-----------------------|-------------------------------|----------|-------|----------|
| <i>time</i> (quarter) | <i>location</i> = "Vancouver" | | | |
| | <i>item</i> (type) | | | |
| | home entertainment | computer | phone | security |
| Q1 | 605 | 825 | 14 | 400 |
| Q2 | 680 | 952 | 31 | 512 |
| Q3 | 812 | 1023 | 30 | 501 |
| Q4 | 927 | 1038 | 38 | 580 |

Facts (numerical measures)

Table 3.2 A 2-D view of sales data for *AllElectronics* according to the dimensions *time* and *item*, where the sales are from branches located in the city of Vancouver. The measure displayed is *dollar_sold* (in thousands).

From Tables and Spreadsheets to Data Cubes (3)

| | <i>location</i> = “Chicago” | | | | <i>location</i> = “New York” | | | | <i>location</i> = “Toronto” | | | | <i>location</i> = “Vancouver” | | | |
|----------------------------|-----------------------------|-------|-------|------|------------------------------|-------|-------|------|-----------------------------|-------|-------|------|-------------------------------|-------|-------|------|
| <i>t i m e</i> | <i>item</i> | | | | <i>item</i> | | | | <i>item</i> | | | | <i>item</i> | | | |
| | home ent. | comp. | phone | sec. | home ent. | comp. | phone | sec. | home ent. | comp. | phone | sec. | home ent. | comp. | phone | sec. |
| Q1 | 854 | 882 | 89 | 623 | 1087 | 968 | 38 | 872 | 818 | 746 | 43 | 591 | 605 | 825 | 14 | 400 |
| Q2 | 943 | 890 | 64 | 698 | 1130 | 1024 | 41 | 925 | 894 | 769 | 52 | 682 | 680 | 952 | 31 | 512 |
| Q3 | 1032 | 924 | 59 | 789 | 1034 | 1048 | 45 | 1002 | 940 | 795 | 58 | 728 | 812 | 1023 | 30 | 501 |
| Q4 | 1129 | 992 | 63 | 870 | 1142 | 1091 | 54 | 984 | 978 | 864 | 59 | 784 | 927 | 1038 | 38 | 580 |

Table 3.3 A 3-D view of sales data for *AllElectronics* according to the dimensions *time*, *item*, and *location*. The measure displayed is *dollar_sold* (in thousands).

From Tables and Spreadsheets to Data Cubes (4)

Figure 3.1 A 3-D data cube representation of the data in Table 3.3, according to the dimensions *time*, *item*, and *location*. The measure displayed is *dollar_sold* (in thousands).

From Tables and Spreadsheets to Data Cubes (5)

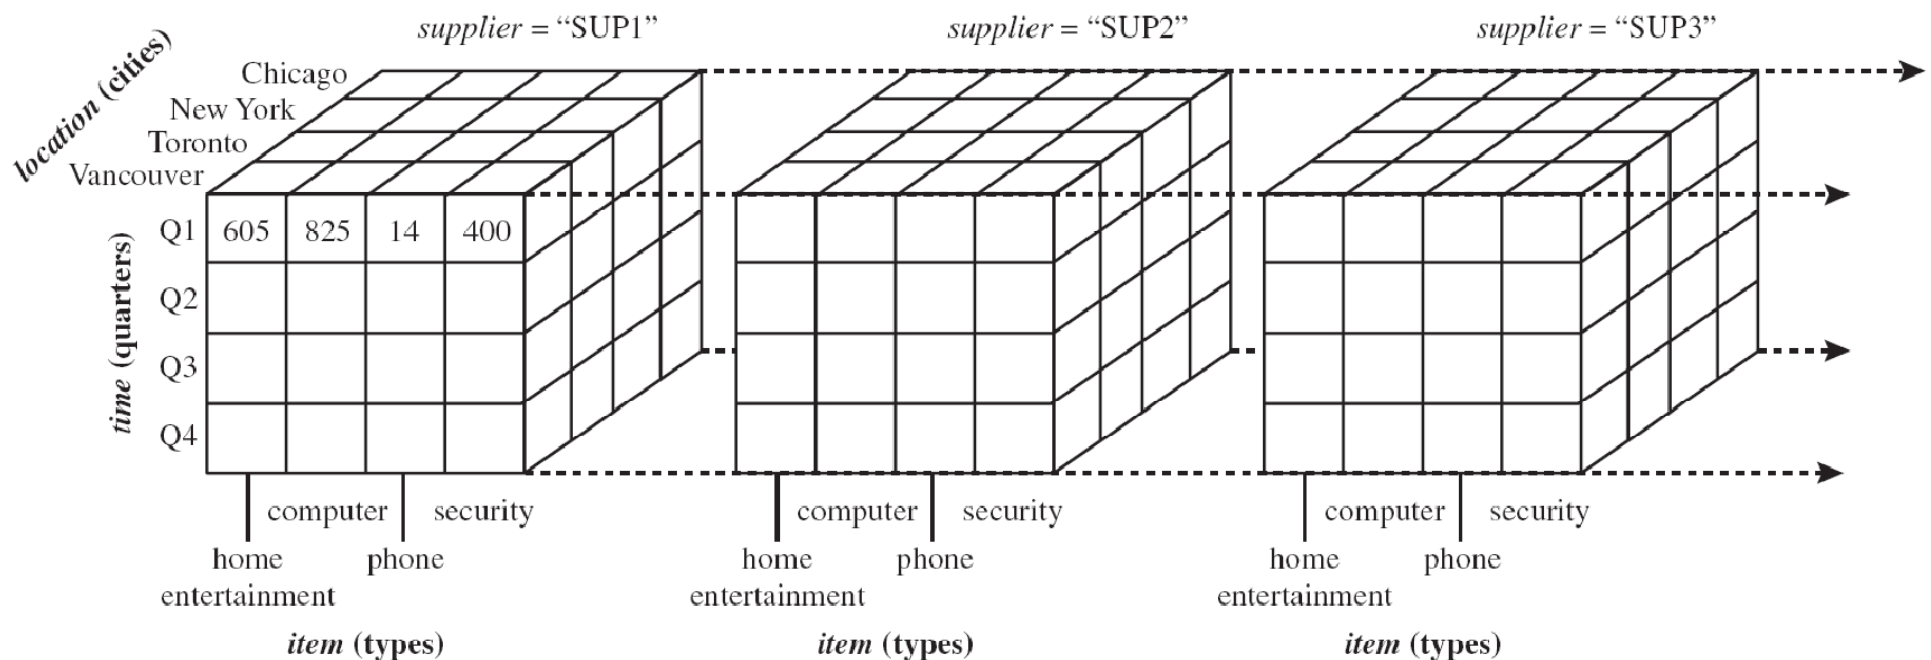

Figure 3.2 A 4-D data cube representation, according to the dimensions *time*, *item*, *location*, and *supplier*. The measure displayed is *dollar_sold* (in thousands).

Cuboid

- A data cube is a lattice of cuboids
- The total number of cuboids
- The apex cuboid
- The base cuboid

Figure 3.14 Lattice of cuboids, making up a 3-D data cube. Each cuboid represents a different group-by. The base cuboid contains the three dimensions city, item, and year.

The Curse of Dimensionality

- How many cuboids are there in a n -dimensional data cube?
- How many cuboids are there in a n -dimensional data cube and each dimension (i) has the number of level, (L_i)?

Conceptual Modeling of Data Warehouses

- Modeling data warehouses: dimensions & measures
 - **Star schema**: A fact table in the middle connected to a set of dimension tables
 - **Snowflake schema**: A refinement of star schema where some dimensional hierarchy is **normalized** into a set of smaller dimension tables, forming a shape similar to snowflake
 - **Fact constellations**: Multiple fact tables share dimension tables, viewed as a collection of stars, therefore called **galaxy schema** or fact constellation

Star Schema

Figure 3.4 Star schema of a data warehouse for sales.

Snowflake Schema

Figure 3.4 Snowflake schema of a data warehouse for sales.

Fact Constellation

Figure 3.5 Fact constellation schema of a data warehouse for sales and shipping.
